## OVERVIEW

# Pedestrian Crosswalk Ahead Alert

### OVERVIEW

At a pedestrian crossing controlled by any pedestrian or cyclist crosswalk systems, the system springs into action as soon as a pedestrian or cyclist presses the activation button. Positioned minimum 115-125 feet ahead of the crosswalk, in compliance with regulations, LED-enhanced warning signs begin to flash, effectively alerting drivers that the crosswalk is in use. This dynamic system significantly improves visibility, increases stopping time, enhances safety, and ensures adherence to regulatory guidelines.

The LED warning signs continue flashing until the crosswalk system cycles off, providing clear, and continuous communication to drivers. Designed for versatility, the system can operate on solar power or AC electricity, customized to location-specific requirements. Connectivity between the warning sign and the crosswalk system is achieved through a Radio Frequency (RF) transmitter.

Advance pedestrian warning signs are vital for road safety, alerting drivers to crossings where visibility is limited. These signs help protect pedestrians, reduce collisions, and encourage safer driving behavior, making them a cornerstone of modern road safety.

These signs can be paired with HAWKs, RRFBs, Flashing beacons or other LED signs.

Beyond safety, these signs encourage active transportation by making crossings safer and more visible. Improved pedestrian infrastructure leads to higher walking and cycling rates, benefiting public health and reducing congestion.
